

Batch Price Update for All Items with PC in Free Field

Overview

This document provides an example of how to increase the price level adjustment percentage for the “A” price level to E plus 150% for all items with “PC” in the FREE field of the item master. “PC” in the Free field denotes “price change” needed. Query was used to plug “PC” in the Free field IF the price level adjustment percentage for the “A” price plan was 135%.

Updating the prices is a two step process:

- (1) Use Price Load Batch to create price records in a temporary price file with the new markup percentage (E +150%) for all items with PC in the FREE field.
- (2) Use Price Load Update to actually update your inventory item master file with the new markup and selling prices.

Use Price Load Batch to Create New Price Records in a Temporary Price File

In this step, new price level adjustment percentages are entered for a vendor code. The program creates price records in a temporary price file.

- a) Select Inventory from Main Menu; select Price Load / INV Count Menu; select Price Load Batch.

Use the sample screen below as a guide.
